# Composing Counterpoint Music With Variable Neighborhood Search

D. Herremans & K. Sörensen

EURO, July 8-11, 2012

# Overview

Computer aided composing (CAC)

Variable Neighborhood Search

Experiments & Results

Implementation

Conclusion

## Computer aided composing (CAC)

Composing music = combinatorial optimization problem

- ▶ Music → combination of notes
- ▶ “Good” music → fits a style as well as possible
- ▶ Formalized and quantified “rules” of a style → objective function

# Counterpoint

- ▶ Polyphonic classical music
- ▶ Inspired Bach, Haydn, . . .
- ▶ One of the most formally defined musical styles  
→ Rules written by Fux in 1725

## 1st species counterpoint

- ▶ Counterpoint & Cantus firmus

- ▶ Represented as 2 vectors with midi values

[ 60 65 64 62 60 64 65 67 67 69 62 64 64 60 59 60 ]

## 5th species counterpoint

- ▶ Counterpoint & Cantus firmus

- ▶ Represented as a vector of note objects, each with:
  - ▶ Pitch: midi value
  - ▶ Duration
  - ▶ Beat number
  - ▶ Measure number
  - ▶ Tied?

## Quantifying musical quality

Examples of rules:

- ▶ Each large leap should be followed by stepwise motion in the opposite direction
- ▶ Half notes should always be consonant on the first beat, unless they are suspended and continued stepwise and downward
- ▶ All perfect intervals should be approached by contrary or oblique motion

→ 19 vertical and 19 horizontal subscores between 0 and 1

## Quantifying musical quality

$$f(s) = \underbrace{\sum_{i=0}^{19} a_i \cdot \text{subscore}_i^H(s)}_{\text{horizontal aspect}} + \underbrace{\sum_{j=0}^{19} b_j \cdot \text{subscore}_j^V(s)}_{\text{vertical aspect}} \quad (1)$$

## Quantifying musical quality

- ▶ Weights  $a_i$  and  $b_j$
- ▶ Specified at input
  - ▶ Emphasize subscore from start
- ▶ Adaptive weights mechanism
  - ▶ Increase weight of subscore with highest value
  - ▶ Keeps the search in the right direction

## Variable Neighborhood Search

- ▶ Local search with 3 neighborhoods
- ▶ Selection
  - ▶ Steepest descent
  - ▶ Based on adaptive score  $f^a(s)$

$N_i$	Name	Description
$N_{sw}$	Swap	Swap two notes
$N_{c1}$	Change1	Change one note
$N_{c2}$	Change2	Change two notes

## Variable Neighborhood Search

- ▶ Excluded fragments
  - ▶ Tabu list
  - ▶ Infeasible
- ▶ Perturbation
  - ▶ Change  $r\%$  of the notes randomly
- ▶ Adaptive weights mechanism
- ▶ Update best solution  $s_{\text{best}}$ , based on original score  $f(s_{\text{best}})$

## Experiments & Results

- Full factorial experiment,  $n=2304$

Parameter	Values	Nr. of levels
$N_{sw}$ - Swap	on with $tt_{sw}=0$ , $tt_{sw}=\frac{1}{16}$ , $tt_{sw}=\frac{1}{8}$ , off	4
$N_{c1}$ - Change1	on with $tt_{c1}=0$ , $tt_{c1}=\frac{1}{16}$ , $tt_{c1}=\frac{1}{8}$ , off	4
$N_{c2}$ - Change2	on with $tt_{c2}=0$ , $tt_{c2}=\frac{1}{16}$ , $tt_{c2}=\frac{1}{8}$ , off	4
Random move	$\frac{1}{4}$ changed, $\frac{1}{8}$ changed, off	3
Adaptive weights	on, off	2
Max. iterations	5, 20, 50	3
Length of music	16, 32 measures	2

## Experiments & Results

- ▶ Multi-Way ANOVA model with interaction effects, using R
- ▶  $R^2 = 0.98$

Parameter	Df	$F$ value	Prob ( $> F$ )
$N_{c1}$	1	9886.2323	$< 2.2e^{-16}$
$N_{c2}$	1	15690.7234	$< 2.2e^{-16}$
$N_{sw}$	1	3909.2959	$< 2.2e^{-16}$
randsize	2	1110.1724	$< 2.2e^{-16}$
maxiters	2	322.6488	$< 2.2e^{-16}$
length	1	165.6053	$< 2.2e^{-16}$
adj. weights	1	4.0298	0.0448367
$tt_{c1}$	2	2.2575	0.1048791
$tt_{c2}$	2	8.271	0.0002646
$tt_{sw}$	2	3.2447	0.0391833

## Experiments & Results

- Mean plot for the size of the random jump

## Optimal parameter settings

Parameter	Value
$N_{sw}$	on with $tt_{sw} = \frac{1}{16}$
$N_{c1}$	on with $tt_{c1} = \frac{1}{16}$
$N_{c2}$	on with $tt_{c2} = \frac{1}{16}$
Random move	$\frac{1}{8}$ changed
Adaptive weights	on
Max. number of iterations	50

## Implementation

- ▶ C++ → VNS
- ▶ JavaScript using the QtScript engine → MuseScore plugin
- ▶ Input:
  - ▶ Key (i.e., G# minor)
  - ▶ Weights for each subscores
  - ▶ VNS parameters
- ▶ Result: MusicXML

# Implementation

The screenshot displays the MuseScore software interface. The top menu bar includes File, Edit, Create, Notes, Layout, Style, Display, Plugins, Optimize, and Help. The 'Optimize' menu is open, showing three options: 'Generate 5th Species Counterpoint', 'Generate 1st Species Counterpoint', and 'Generate Cantus Firmus'. The 'endmusic' palette is visible on the left, listing various musical elements like Grace Notes, Drums, Clefs, Key Signatures, Time Signatures, Bar lines, Lines, Arpeggio & Glissando, Breath & Pauses, Brackets, Articulations & Ornaments, Accidentals, Dynamics, Fingering, Note Heads, Tremolo, Repeats, Breaks & Spacer, Beam Properties, and Symbols. The main workspace shows a score titled 'endmusic' with a yellow background. The score is labeled 'Generated Music' and includes a 'Optimize' button. The score consists of three staves: Part 1 (treble clef), Part 2 (bass clef), and a third system (treble and bass clefs). The music is in 4/4 time and features a melody in the treble clef and a bass line in the bass clef.

# Results

- ▶ Example of a generated fragment with score 0.556776.

## Conclusion

The fifth species counterpoint rules have been quantified and an efficient algorithm has been implemented to compose this style of music

Future research:

- ▶ More complex music:
  - ▶ Different styles
  - ▶ More parts
  - ▶ Theme
- ▶ Analyse DB of existing music and extract composer characteristics
- ▶ Android App for continuously generating music
